Business Analytics Report

Executive Summary

Behind every title in Netflix's catalogue is a story, and behind every story, there is a choice to be made. A series of decisions combined to determine which story the audience will see. This analysis examines the massive catalogue of movies and television shows available on Netflix through an interactive Tableau Dashboard to explore patterns and insights for the business.

In this analysis, we aim to clarify the contrast between Movies and TV shows, identify rankings across categories, assess the geographic footprint by country, and examine maturity ratings. In addition, a comparison will be made for the work done by cast members (performers) and directors.

The findings reveal a predominantly movie-based catalogue: with Movies representing 68.41% of the titles, compared with 31.59% for TV Shows. International Movies, Dramas, and Comedies make up the largest recorded categories, while the United States, India, and the United Kingdom are significant for geographic comparisons. The Netflix catalogue saw an increase in titles from 2016, while TV-MA and TV-14 led the ranking of maturity-rated titles. In addition, observations by the cast and director revealed a concealed count in the category profiles which then led to a more informative, project-specific experience.

These results provide Netflix's acquisition teams with a basis for making decisions on category-specific projects. At the same time, its commissioning teams have an initial reference for directorial choices or talent discussions with agencies and production partners. Furthermore, investors can view the catalogue and the concentration of work using this historical data to potentially make an investment.

However, at the same time the data's historical coverage consists of incomplete metadata, overlapping categories, and ranking restrictions that limit interpretation. The catalogue composition does not directly infer audience demand, the profitability of works, whether talent is suitable for a story, or even that a one-season show automatically indicates cancellation.

Furthermore, future analysis could include validating catalogue ranking with viewer engagement, subscriber retention, license availability, and the cost of producing content.
The aim of this report is to provide a more in-depth analysis of the interactive dashboard. To deliver a more practical method for content and catalogue selection. At the same time, provide stakeholders with relevant information and guidance to make informed business decisions.

Introduction

With the increasing accessibility of digital technology worldwide, the entertainment industry has undergone significant changes. Modern audiences have increasingly shifted towards streaming services and home-based entertainment, particularly with the growing availability of on-demand content. This transition was further accelerated by the COVID-19 pandemic, which led to the closure of cinemas and various entertainment facilities, making streaming platforms the preferred choice for audiences worldwide. During this period, Netflix experienced a substantial surge in viewership, with users spending approximately one hour and 11 minutes per day on the platform. By early 2020, Netflix had gained approximately 16 million new subscribers, highlighting the growing demand for on-demand video streaming services. [1]

Netflix successfully transitioned from a DVD rental business model to a subscription-based video-on-demand (SVOD) platform, establishing itself as a major player in the global streaming industry. As of 2025, Netflix had approximately 282.7 million subscribers, representing an increase of 22.42 million subscribers compared with 2023. In the United States, Netflix had approximately 66.7 million subscribers, accounting for around 21% of the SVOD market and making it the second-most preferred streaming platform in the country. This widespread adoption highlights Netflix's ability to respond to changing consumer preferences and adapt to evolving market dynamics. [1] However, continued growth also brings new challenges. To sustain its business value and remain competitive, Netflix must continue developing innovative, contemporary strategies to retain existing subscribers and attract new ones. Developing a comprehensive understanding of Netflix's content catalog and consumer demographics is therefore essential for identifying audience preferences, emerging trends, and opportunities for future growth. Such analysis also serves as a valuable reference for guiding resource allocation and investment decisions.

The primary objective of this report is to conduct an exploratory analysis of the Netflix content catalogue, using a dataset of 6,232 titles released across 113 countries and visualized through an interactive Tableau dashboard. The analysis examines several dimensions of the catalogue, identifying patterns in content type, genre, geography, target audience, and talent. Together, these perspectives offer a comprehensive picture of how Netflix's content library is structured and how it has evolved over time.

Problem Statement

Netflix maintains a large and continually growing content catalog, yet the volume of its scale makes it difficult to form a clear, evidence-based understanding of what that catalog actually contains and how it has evolved. Stakeholders seeking to understand content strategy and consumer demographic whether for competitive benchmarking, content planning or market analysis are faced with raw, unstructured data rather than clear and actionable insight. Without a structured analytical approach, several important aspects of the catalog remain poorly understood.

Content composition: It is unclear what proportion of the catalog is made up of movies versus TV shows and whether this balance has shifted as the platform has matured.

Genre trends: The relative prevalence of different genres and whether these preferences differ by country of origin, is not readily apparent from the raw data.

Audience targeting: Content ratings are recorded in the dataset, but there is no immediate way to interpret what age groups or audience segments Netflix's catalog is weighted towards.
Production trends over time: How content output across categories has changed year to year is difficult to assess without visualization, limiting the ability to identify growth areas or shifts in strategic focus.

This report addresses these gaps by transforming the raw dataset into a structured, interactive dashboard, enabling each of the above questions to be answered clearly and supported with visual evidence. The remainder of this report documents the approach taken and presents the resulting findings.

Stakeholders

Stakeholder	Type	Relationship to Analysis
Content Strategy and Content Acquisition Team	Direct	Uses category and catalogue growth insights to identify content gaps, prioritize acquisition and balance investment across established and emerging categories.
Marketing Team	Direct	Uses category trends and catalogue expansion patterns to develop targeted campaigns, promote underrepresented content and align promotions with audience interests.
Investors	Direct	Uses catalogue growth and content diversification insights to assess Netflix's content investment strategy and potential for long-term growth.
Client leadership (agency directors / policy unit)	Direct	Primary audience for the dashboard; uses findings to set funding priorities.
National film and TV production boards	Direct	Uses country-level category gaps to design grant programs and co-production treaties.
Local independent producers and studios	Direct	Benefit from targeted incentives; may use evidence of category under-supply to pitch projects.
Streaming platforms (Netflix and competitors)	Indirect	Use category demand signals to guide commissioning decisions.
Audiences and cultural communities	Indirect	Affected by availability (or absence) of locally relevant content categories.
Government treasury / finance ministry	Indirect	Concerned with the economic return on production incentives.
Cultural heritage and language	Indirect	Concerned with under-representation of local

preservation bodies		language and children's content.
Cast and directors (creative labor)	Indirect	Represented in the Popular Cast Analysis and Director Distribution views; their concentration has labor-market implications.

Objective or goals of analysis

Objective 1

Evaluate Portfolio Composition and Type Distribution: Quantify the exact balance between Movies and TV Shows across the catalog, establishing benchmark percentages to evaluate licensing and original production spend.

Objective 2

Assess Production Trends Over Time: Analyze content addition velocity across historical release years to pinpoint strategic inflection points in streaming adoption and identify post-2019 trajectory changes.

Objective 3

Identify Geographic Sourcing and Localization Gaps: Map production countries against category offerings to uncover market saturation and target high-potential regional licensing hubs.

Objective 4

Map Audience Demographics via Standardized Classifications: Group complex mature ratings into structured target audience segments (Kids, Teens, Adults) to guide balanced demographic catalog acquisition.

Objective 5

Examine cast and director representation across content categories to inform further investment of creative-sector participation and potential partnerships.

Primary Findings

KPI

The dataset contains 6,232 Netflix titles, offering a broad view of the platform's catalogue. Movies dominate the library, accounting for 68.41% of all titles, while TV shows make up the remaining 31.59%. The average movie runs 99.11 minutes, which is consistent with a standard feature-length film. Among TV shows, most are short-lived or limited in scope. Around 67.09% have only one season, compared with 32.91% that run for multiple seasons.

Total Titles	6,232
% Movies	68.41%
Avg Movie Length (min)	99.11mins
% TV Shows	31.59%
% One-Season Show	67.09%
% Multi-Season Show	32.91%
Total Genres	42
Total Rating Labels	14
Total Countries	113
Total Casts	27,397
Total Directors	3,653

Figure 2 – KPI

The catalogue is also highly diverse. It spans 42 genres and 14 rating labels, catering to a wide range of tastes and audience age groups. Content originates from 113 countries, reflecting the platform's strong international reach. In terms of talent, the dataset records 27,397 cast members and 3,653 directors.

Finding 1

Categorical Disposition: The analysis on Netflix's content catalogue shows a clear concentration in several major categories. International Movies have the highest representation, with 1927 titles, making this category substantially larger than any other category shown in the analysis. Dramas are the second most represented category, with approximately 1623 titles, followed by Comedies, with around 1112 titles. International TV Shows also have a strong presence, accounting for approximately 1001 titles in the catalogue.

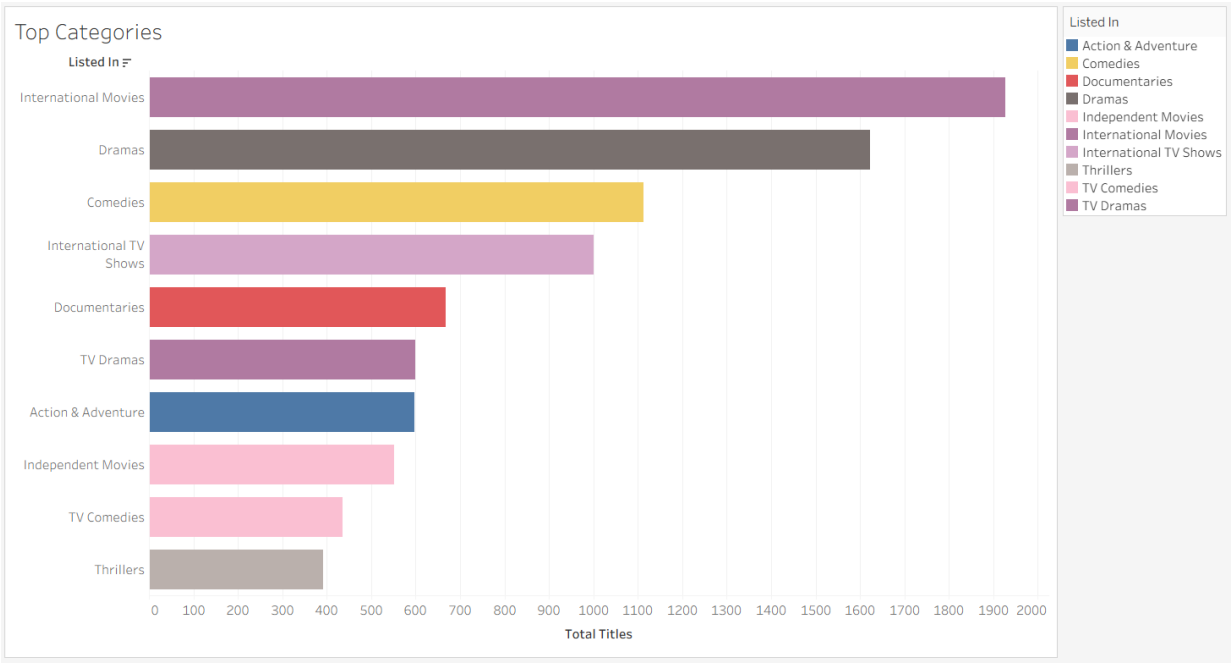

Figure 3 - Top Categories by Country of Origin

The remaining categories have comparatively smaller numbers of titles. Documentaries contain 667 titles, while TV Dramas and Action & Adventure each have around 600 titles. Independent Movies account for 552 titles, followed by TV Comedies with around 436 titles. Thrillers have the lowest representation among the categories displayed, with approximately 392 titles. Overall, there is a substantial gap between the largest and smallest categories, with International Movies containing almost five times as many titles as Thrillers.

The distribution also indicates that Netflix's catalogue is more heavily concentrated around movies than television-based categories within several of the major groupings. International Movies, Dramas, Comedies and Independent Movies collectively represent a large proportion of the categories shown, whereas specialized television categories such as TV Comedies and TV Dramas have comparatively fewer titles. The particularly high number of International Movies and International TV Shows further highlights the significant role of international content within Netflix's overall catalogue.

Actionable insight: This insight would primarily benefit the Content Strategy and Content Acquisition teams, as it could support more data-driven decisions about where to allocate future content budgets. It could also benefit the Marketing and Personalization teams, which could use information about underrepresented categories to develop targeted promotions and improve personalized recommendations. Ultimately, understanding catalogue distribution would help Netflix with viewer engagement planning while ensuring that future content investments are aligned with audience preferences and business objectives.

Finding 2

Catalogue Expansion Over Time: The analysis of Netflix's catalogue over time shows a substantial increase in the number of titles added to the platform between 2008 and 2020, with the most significant growth occurring from 2016 onwards. It is important to note that this analysis is based on the Year of Date Added, rather than the original release year of the content. Therefore, the chart represents the growth and expansion of Netflix's catalogue over time and does not necessarily indicate when the movies or TV shows were originally produced.

In the early years between 2008 and 2014, Netflix added a relatively small number of titles across the categories shown. The number of additions remained comparatively low, with most categories recording only a small number of titles. A gradual increase can be observed around 2014 and 2015, followed by a much more noticeable expansion from 2016 onwards.

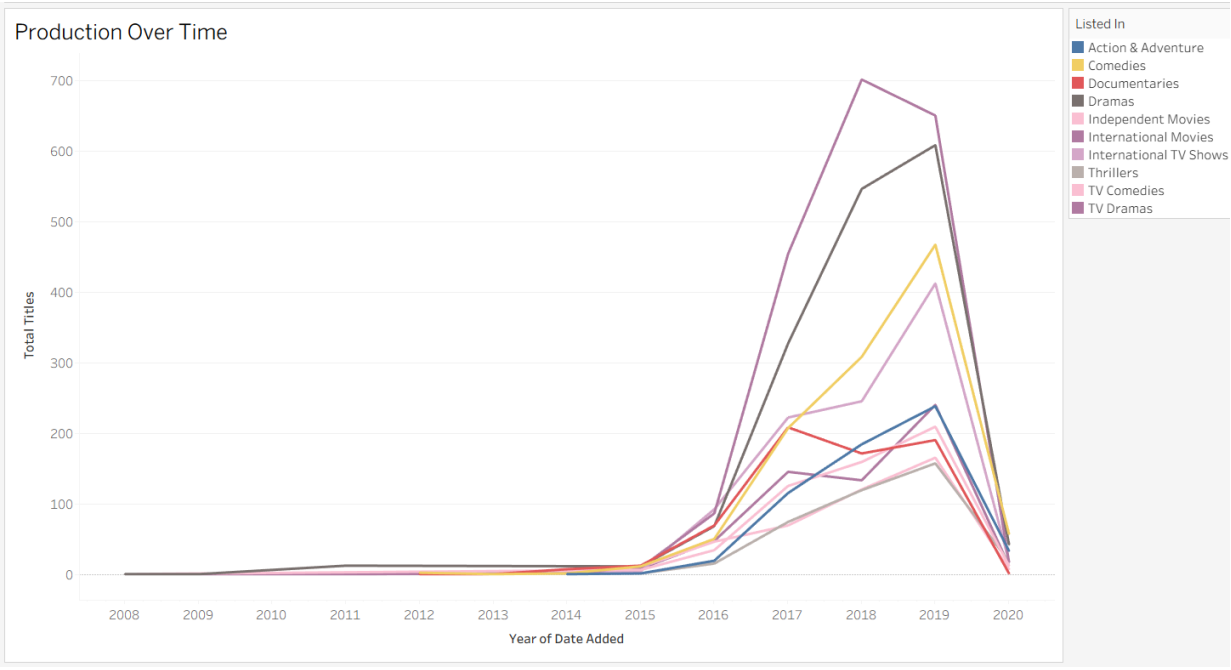

Figure 4 – Content Production Over Time

The most significant growth occurred between 2016 and 2018. During this period, the number of titles added increased substantially across almost every category. International Movies experienced a major increase, rising from approximately 87 titles in 2016 to 702 titles in 2018. Although the number decreased slightly in 2019, International Movies remained one of the most prominent categories. This pattern suggests that Netflix significantly expanded the availability of international movie content during the period of rapid catalogue growth. But other categories made a steady rise through 2019. Comedies increased steadily and reached 468 titles in 2019, while International TV Shows increased to 413 titles. Documentaries and Thrillers showed comparatively lower levels of growth, although each category still experienced an increase in the number of titles added during the later years.

The number of titles added in 2019 was considerably higher than in the earlier years, making 2019 the peak period for most of the categories displayed. This suggests a period of aggressive catalogue expansion, where Netflix was adding content across a broad range of genres rather than relying on a single category.

The chart shows a noticeable decline in the number of titles added in 2020. However, this does not automatically interpret a reduction in Netflix's overall content production. The dataset records when titles were added to Netflix and the 2020 data represent only part of the year, not a full year. Therefore, the lower number of titles in 2020 could partly reflect the limited period covered by the dataset rather than a genuine decline in Netflix's content strategy.

Actionable insights: Based on these findings, Netflix's Content Strategy and Content

Acquisition teams could use the catalogue growth trends to evaluate how effectively different types of content contribute to the platform's overall value. Since the dataset includes both newly released and older titles, Netflix could compare the performance of older acquired content against newer productions using metrics such as viewing hours, completion rates, ratings, repeat viewing and subscriber engagement. This analysis would particularly benefit the Content Strategy, Content Acquisition, and Finance teams, as it could help them determine how to allocate content budgets between new productions, recent releases, and older catalogue content. The Marketing and Personalization teams could also use these findings to promote older titles that demonstrate strong viewer engagement but may have lower visibility.

Finding 3

Geographic Footprint: The catalogue is anchored by the US but shows deliberate diversification into Asian and European production hubs

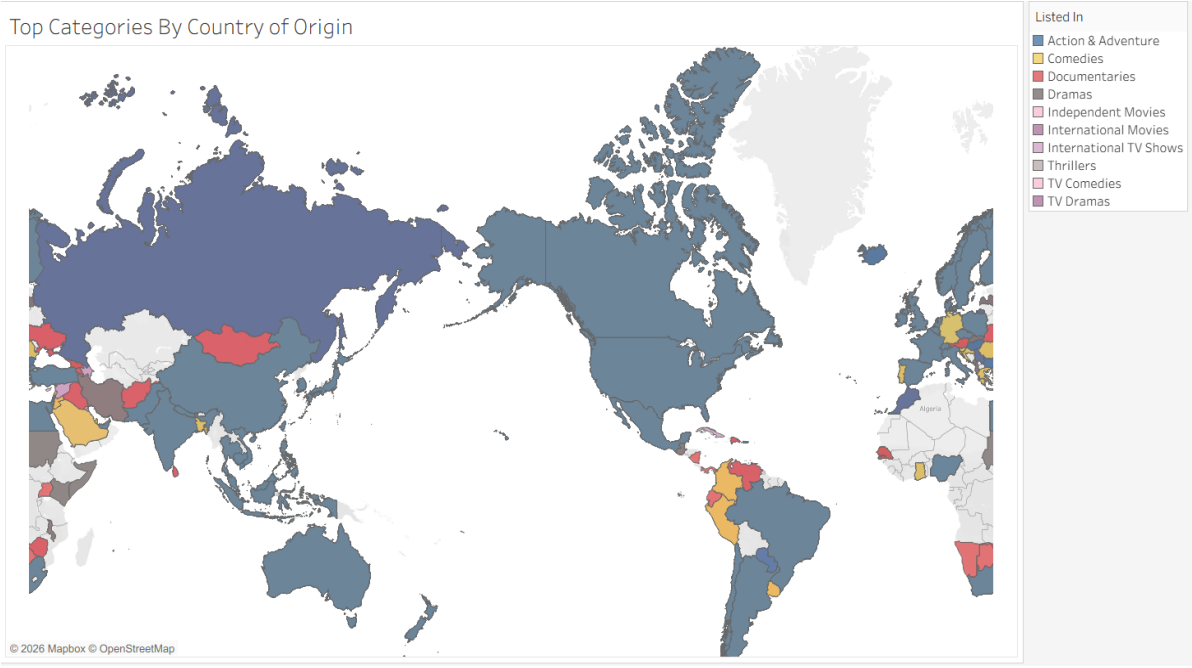

Figure 5 - Top Categories by Country of Origin

The United States leads overall title volume by a substantial margin, followed by India and the United Kingdom. This tier-1 group reflects the three largest English-language and English-adjacent production ecosystems in the world, and together they account for the majority of catalogue entries.

Japan, South Korea, Spain, France, Canada, Germany, and Mexico — round out the top tier. Each of these markets has a heavily capitalized domestic production ecosystem (Japan's anime industry, Korea's K-drama sector, Spain's and Mexico's telenovela industries, France's and Germany's public-broadcast traditions, Canada's co-production incentives). Their presence in the top ten reflects deliberate regional investment rather than incidental licensing.

Actionable insight: While the library remains anchored by US content, strong growth in Asian markets (India, South Korea, Japan) highlights a strategy to capture international subscriber growth and fulfil local content quotas required by regional broadcast authorities. For the client, this means the top ten list is not a single policy category: the US and UK

represent mature, saturated markets, whereas India, Korea, and Japan represent high-growth markets where incentive programs and co-production treaties are likely to have the largest marginal effect. The near-zero regions across Africa and Central Asia represent the clearest white-space opportunities for partnership, but any intervention there should be preceded by a validation exercise against national film-board data, since cast count is a proxy for production volume rather than a direct measure.

Finding 4

Rating Breakdown: Mature-audience content dominates the catalogue, with a wide format-dependent split between film and episodic ratings

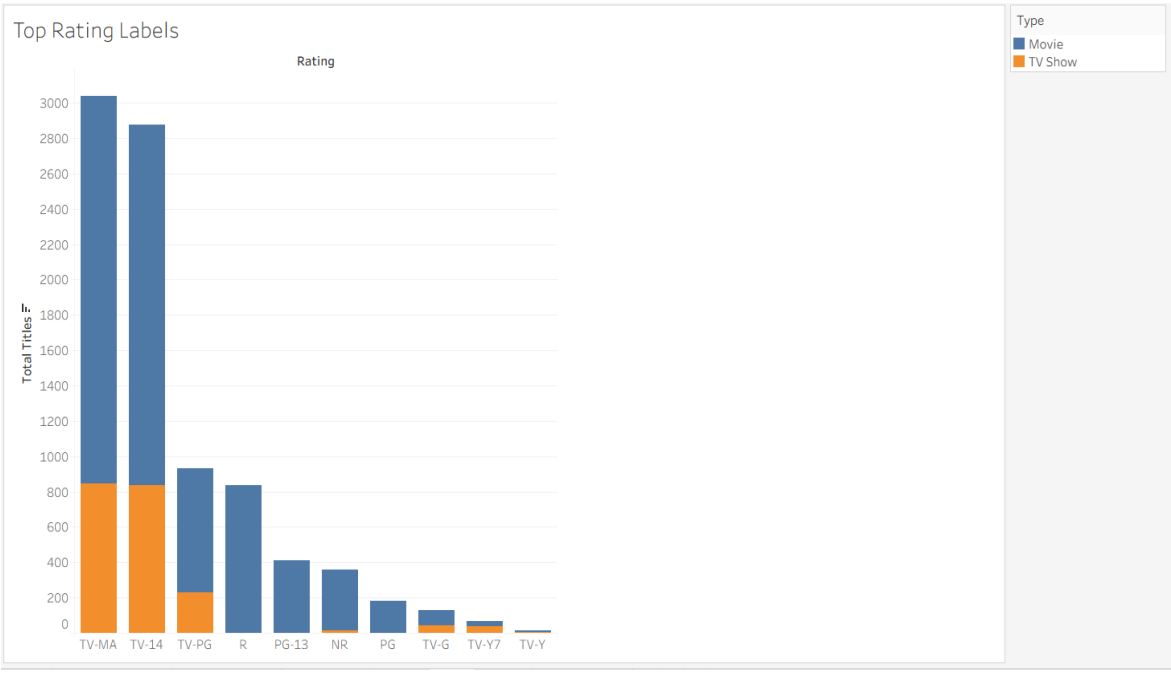

Figure 6 - Top Rating Labels

TV-MA (Mature Audience) and TV-14 (Parents Strongly Cautioned) together constitute the overwhelming majority of the total catalogue. This is the single most distinctive feature of the age-based view: two rating bands absorb the bulk of all titles, and every other band is comparatively thin.

Film and TV ratings diverge because they use different classification systems. Feature films spread across R, PG-13, and PG, while episodic content clusters on TV-MA and TV-14, with TV-PG a distant third. Because MPAA-style film ratings and TV parental guidelines do not map one-to-one onto each other, any direct share-of-catalogue comparison between the two formats should be treated as directional rather than exact. What the split does show clearly is that both formats are oriented toward teen and adult audiences, and that no single rating band dominates film the way TV-MA and TV-14 dominate series. Family and kids' content is correspondingly under-represented. General-audience bands such as TV-Y, TV-Y7, G, and PG occupy a small slice of the catalogue relative to the size of the addressable family audience, confirming that acquisition and commissioning remain centered on teens and adults. The practical consequence is that the tail is thin, and thin tails are cheap to move: because children's and general-audience bands are so small in absolute terms, even a modest increase in titles produces a large percentage gain in those bands. This makes them the highest-leverage target for a measurable policy intervention — small spend, visible result.

Actionable insight - The concentration of mature ratings (TV-MA and TV-14) reflects Netflix's positioning as a premium destination for teens and adults, balancing family options against edgy original programming. For the client, this produces two distinct implications: if the mandate covers children's and early-years content, the rating gap justifies a dedicated children's co-production fund, since that band is most exposed to market under-supply; if the mandate is cultural export, the dominance of TV-MA and TV-14 signals that mature-audience drama travels best internationally, making co-production incentives for that band more likely to yield titles with global reach.

Finding 5

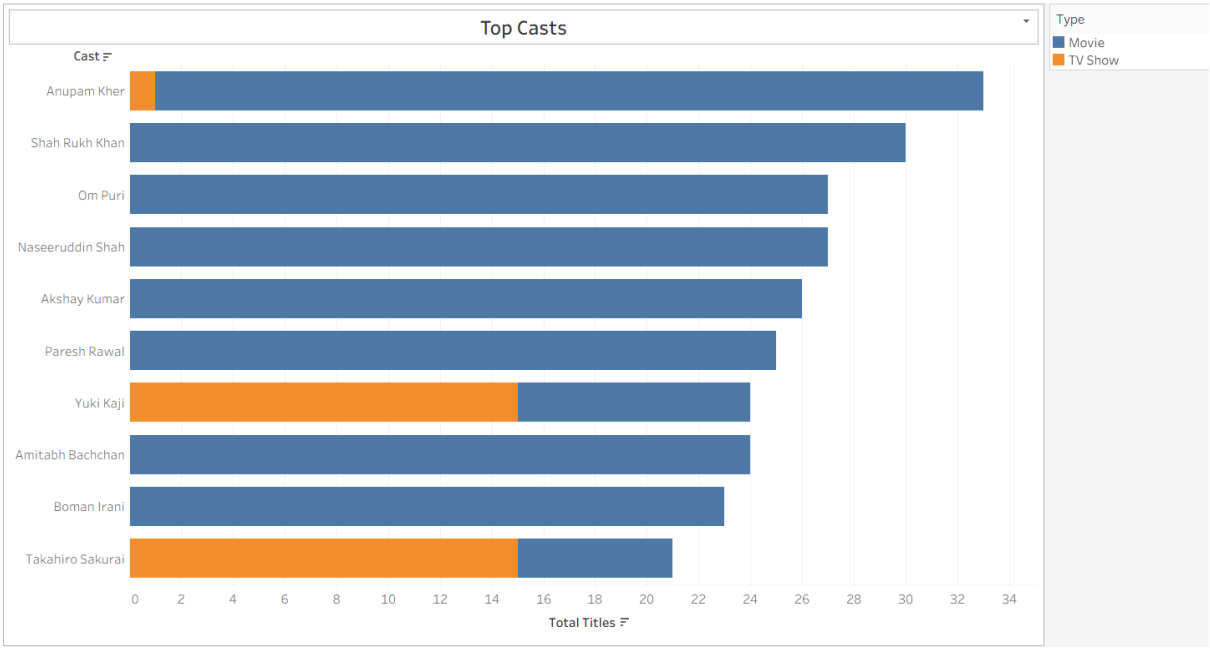

Figure 7 - Top Casts

Cast Experience Across Content Formats Informs Netflix's Casting Decisions: The Top Cast analysis supports Objective 5 by showing how performers' historical appearances are distributed between Movies and TV Shows. This graph provides the commissioning team with an initial reference to identify entertainers whose prior work could be relevant to a planned future project.

Anupam Kher, Shah Rukh Khan and Naseeruddin Shah all have long displayed bars, with approximately 33, 30, and 27 counts, respectively, and predominantly based on Movies. Their profiles provide a starting point for reviewing previous film roles when Netflix commissions a cast for a movie. In contrast, Yuki Kaji and Takahiro Sakurai each have approximately 15 TV show counts indicating more experience in TV production.

These differences help Netflix organize casting research opportunities around the needs of its next production. Movie-associated profiles can guide reviews of relevant film performances, while television-associated profiles can support research for episodic projects. The distinction also encourages commissioning teams to consider the performance medium, language, genre, and character requirements alongside their experience with format. Catalogue appearances provide a useful record of previous participation, although suitability for a new role requires a separate assessment.

Actionable insight: Netflix's commissioning team can use the graph to prepare a preliminary list of performers for discussion with production partners and casting directors. The casting team can also review relevant previous roles, assess auditions and availability, and compare fees against production budget. This focuses more on candidate research, gives casting discussions a clear evidence base, and helps Netflix identify performers whose experience aligns with the proposed project.

Finding 6

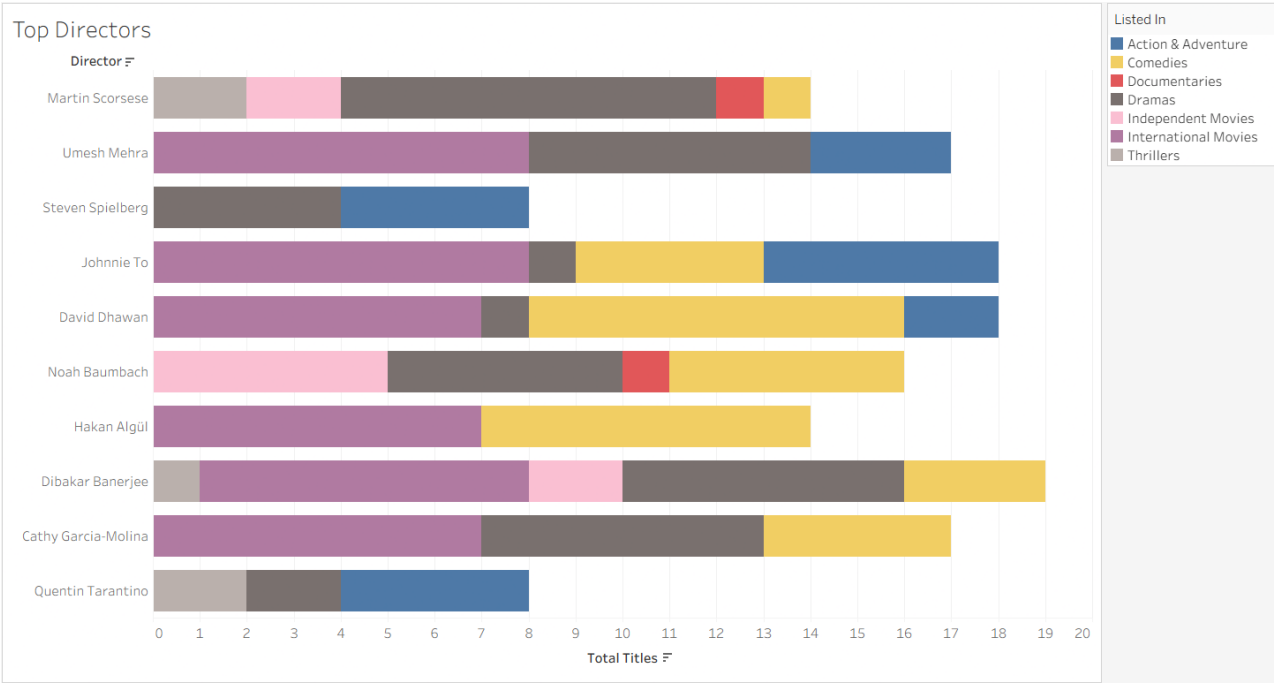

Figure 8 - Top 10 Directors by Title (Category)

The Top Directors analysis supports Objective 5 by showing the categories associated with directors recorded titles in Netflix's catalogue. For the Netflix Content Acquisition team, this helps identify productions to review when expanding a particular category. The main finding is that directors with similar displayed totals can contribute differently to the catalogue, making category composition useful alongside overall title representation.

Johnnie To and David Dhawan each have approximately 18 displayed category counts, but their distributions differ. Dhawan has eight Comedy counts compared with To's four, while To has five Action & Adventure counts compared with Dhawan's two. This makes Dhawan's Comedy titles a good starting point for acquisition research: Dhawan's recorded comedies are relevant to a comedy expansion, while To's action productions are relevant to an Action & Adventure priority. Their similar totals therefore conceal differences that matter when selecting titles for a specific catalogue need.

The other directors offer additional options. Martin Scorsese has eight Drama counts, while Hakan Algul has seven Comedy counts; Baumbach's distribution illustrates how productions can contribute to several classifications. Because a title may belong to multiple categories, these segments describe category coverage and should not be added together as though each represents a separate film. The analysis nevertheless helps Netflix connect a category priority with relevant productions review.

Actionable insight: If Netflix plans to expand its comedy offering, the acquisition team can review Dhawan's and Algul's productions, identify relevant titles absent from its current holdings, and assess their licensing availability in target territories. It can apply the same process to To's action titles or Scorsese's dramas. Comparing these candidates with audience engagement for similar titles and proposed licensing fees would help Netflix decide which acquisitions best meet its content priorities and budget.

Secondary Findings

Secondary Finding 1

Duration Metric Divergence Between Formats

Analysis - Evaluating runtime distribution highlights a structural data anomaly: Movies are measured in continuous runtime minutes (duration_minutes), averaging approximately 99-105 minutes, whereas TV Shows are measured in discrete season counts (duration_seasons), where over 65% of series end after Season 1.

Strategic Justification: The rapid drop-off after Season 1 indicates a high cancellation rate for original series or single-season licensing deals. Extending successful TV series into Seasons 2 and 3 provides better ROI than continually launching new single-season titles.

Secondary Finding 2

Ambiguous Column Names Highlight the Need for Clear Metadata

Analysis: Column names form part of the dataset metadata, but labels such as type, listed_in, and country do not fully explain their meaning. For example, type distinguishes Movies from TV Shows, while listed_in records content categories. Without supporting definitions, users may interpret country associations as market availability or confuse date_added with the release date. This demonstrates how insufficient descriptive metadata can affect analytical accuracy.

Strategic Justification: The analytics team should create a data dictionary documenting each field's definition, data type, units, source, and treatment of missing values. Descriptive dashboard labels should accompany these definitions. This would improve stakeholder understanding, reduce inconsistent interpretations, and allow future analysts to reproduce and extend the work.

Secondary Finding 3

The Timeline Gap Reveals Netflix's Long-Tail Content Strategy
Analysis: Another important finding from the underlying dataset is the timeline gap between a title's original release year and the year it was added to Netflix. Although the catalogue-addition chart begins with titles being added from 2008 onwards, the dataset contains content originally released decades earlier, including movies from the 1920s through the 1990s. This means that the year a title was added to Netflix does not necessarily represent the age or production period of the content. Instead, Netflix's catalogue includes a combination of newly released productions and older titles that were subsequently acquired and made available on the platform. This distinction is important because the rapid increase in titles added between 2016 and 2019 may therefore reflect not only Netflix's investment in new content, but also the expansion of its library through the acquisition of existing content.

Strategic Justification: The Content Acquisition and Finance teams could use the release-year and date-added gap to evaluate the long-term value of licensed and older catalogue content.

By comparing the age of content with metrics such as viewing hours, completion rates, subscriber engagement, and acquisition costs, Netflix could determine whether older titles continue to generate sufficient value after being added to the platform. This could support a balanced content investment strategy in which Netflix combines new original productions with strategically acquired back-catalogue content, potentially allowing it to provide greater content variety while managing production and licensing expenditure.

Conclusion

The value of Netflix's catalogue lies not simply in its size, but in how effectively its content can serve audiences. This project developed an interactive Tableau dashboard to examine 6,232 recorded titles and support Netflix's content planning, acquisition, and commissioning decisions. Five related tables, connected through title identifiers, enabled comparisons of content types, categories, country associations, maturity ratings, cast, and directors. Data filtering, distinct-title calculations, geographic mapping, and temporal visualizations for viewing time series data, transformed the source records into accessible analytical findings.

The catalogue is concentrated in International Movies (1,927 titles), Dramas (approximately 1,623), and Comedies (approximately 1,112), with International Movies containing almost five times as many titles as Thrillers, the smallest of the top 10 categories. These differences help Content Strategy and Acquisition teams with a benchmark for reviewing category coverage. Marketing and Personalization teams can also identify content for targeted promotion, with subsequent engagement results informing promotional and acquisition priorities.

The temporal analysis distinguishes catalogue additions from content production. Increased recorded additions from 2016 onwards indicate when titles entered Netflix's catalogue, including earlier releases. Consequently, this trend cannot be interpreted solely as growth in new commissions or recent releases. It supports evaluating the contribution of older acquired titles alongside newly produced content.

Geographic comparisons identify the United States, India and the United Kingdom as the most represented countries, alongside contributions from other Asian and European countries. These patterns can guide regional acquisition and partnership reviews, although audience demand, licensing availability, and local production data are needed to assess opportunities in less-represented regions. Similarly, the prominence of TV-MA and TV-14 indicates substantial representation of content suitable for older audiences, rather than establishing the demographics of Netflix's subscribers. Content managers should therefore assess catalogue coverage alongside engagement within their intended audience segments.

Talent analyses support different decisions. Cast profiles provide an initial basis for project-specific shortlists, with casting directors subsequently assessing previous roles, character suitability, availability, and fees. Director profiles help acquisition teams identify relevant productions for category expansion, including comedies associated with Dhawan and Algul, action titles with To, and dramas with Scorsese. Territorial rights, licensing costs, and engagement with comparable titles should then inform acquisition decisions.

These conclusions remain subject to the dataset's historical coverage, incomplete metadata, overlapping categories, and ranking restrictions. Category-based stacked totals may exceed unique-title counts, while missing removal dates prevent measurement of net catalogue growth. Incomplete 2020 coverage also limits annual comparisons. Catalogue representation alone cannot establish audience demand, talent suitability, or financial returns, and one recorded television season does not demonstrate cancellation.

Future analysis should integrate engagement, subscriber retention, licensing availability, and content costs, using comparable reporting periods. Acquisition teams can then evaluate specific titles; commissioning teams can assess creative partnerships, and Finance teams and investors can review the resulting costs and benefits. Wider cultural and production stakeholders should supplement catalogue patterns with language, workforce, and national production data before

recommending interventions. Stronger metadata documentation and validated counting methods would enable future analysts to extend the dashboard into a more reliable basis for content and investment decisions.

Appendices

This section outlines data preparation and analytical approach used to produce the findings presented in the report

Data Source and Structure

The analysis is based on a Netflix titles dataset comprising five related tables: a core netflix_titles table containing title-level attributes including type, title, release year, date added, duration, rating and description and four supporting tables recording each title's associated directors, cast members, countries of origin and genre categories. These tables are linked via a common show_id field, allowing a single title to be associated with multiple cast members, countries or genres where applicable.

Data Cleaning

The raw dataset contained 6,236 records. On inspection, a small number of records were found to contain invalid or missing values — including blank type entries and a malformed release year value that fell clearly outside any plausible range. To address this, two data source filters were applied within Tableau:

- Release Year: restricted to the range 1925–2026, removing entries with missing or clearly erroneous values.
- Type: restricted to valid content types (Movie and TV Show), excluding records with blank or invalid type values.

Applying these filters removed 4 invalid records, leaving a final analysis dataset of 6,232 titles. This cleaned dataset forms the basis for all subsequent analysis and visualizations in this report.

Calculated Fields

To support reporting and the dashboard's KPI overview, several calculated fields were created in Tableau in addition to the dataset's original fields:

Calculated Field	Description
Total Titles	Total count of titles in the cleaned dataset
Total Movies & Total TV Shows	Count of titles by content type
% Movies & % TV Shows	Proportion of the catalogue represented by each content type
Avg Movie Length (min)	Average duration of movie measured in minutes
% One-Season Shows	Share of TV shows that have only one season
% Multi-Season Shows	Share of TV shows that have two or more seasons
Total Casts	Count of distinct cast members across the catalogue
Total Directors	Count of distinct directors across the catalogue
Total Countries	Count of distinct countries of origin represented
Total Genres	Count of distinct genre categories (listed_in)
Total Rating Labels	Count of distinct content rating classifications

Formula Reference

Calculated Field	Formula
Total Titles	COUNTD([Show Id])
Total Movies	COUNTD(IF [Type]='Movie' THEN [Show Id] END)
Total TV Shows	COUNTD(IF [Type]='TV Show' THEN [Show Id] END)
% Movies	[Total Movies] / [Total Titles]
% TV Shows	[Total TV Shows] / [Total Titles]
Avg Movie Length (min)	AVG(IF [Type]='Movie' THEN [Duration Minutes] END)
% One-Season Shows	COUNTD(IF [Type]='TV Show' AND [Duration Seasons]=1 THEN [Show Id] END) / [Total TV Shows]
% Multi-Season Shows	COUNTD(IF [Type]='TV Show' AND [Duration Seasons]>1 THEN [Show Id] END) / [Total TV Shows]
Total Casts	COUNTD([Cast])
Total Directors	COUNTD([Director])
Total Countries	COUNTD([Country])
Total Genres	COUNTD([Listed In])
Total Rating Labels	COUNTD([Rating])

Dashboard Development

The cleaned dataset was visualized using Tableau Desktop to produce an interactive dashboard comprising multiple linked views, including: the top content categories overall and by country of origin; the distribution of content ratings, mapped to corresponding age groups, production trends over time and the most frequently recurring directors and cast members.
